

# Engineering Take Home

🕒 Suggested time: 90 minutes

## Engineering Impact Dashboard Assignment

### Overview

Welcome! At Weave, we help engineering teams understand their productivity and impact. For this assignment, you'll analyze real GitHub data to identify impactful engineers.

### The Task

[PostHog](#) is a popular open-source company. Using the [PostHog GitHub repository](#), create an analysis and dashboard that identifies the most impactful engineers.

Every engineer knows that counting lines of code, commits, reviews, etc. does not define someone's impact. Think carefully about how you can meaningfully capture an engineer's contributions. **This is the single thing we care the most about for this challenge.** An ugly UI with creative analysis is better than a beautiful UI with a simple metric based on lines of code, number of commits, files changed, etc.

The expected audience is a busy engineering leader on the PostHog team. Assume they understand the basics of what people do but they aren't in the weeds enough to read every line of code or PR description.

The end result should fit onto a single page on a laptop screen.

#### Your job:

1. Define what "impact" means for software engineers (there's no one right answer!)
2. Gather relevant data from the PostHog repo. Make sure to include all data from at least the last 90 days.
3. Analyze the data
4. Create an interactive dashboard showing who the top 5 most impactful engineers are and why
5. Host it somewhere we can view it

**Time limit:** 1 hour 30 minutes. Start a timer when you begin, stop it when you finish, and
